

## Pentagon Pollution, 7: The Military Assault on Global Climate

---

- The projected full costs of the Iraq war (estimated \$3 trillion) would cover “all of the global investments in renewable power generation” needed between now and 2030 to reverse global warming trends.
- Between 2003-2007, the war generated at least 141 million metric tons of carbon dioxide equivalent (CO<sub>2</sub>e), more each year of the war than 139 of the world’s countries release annually. Rebuilding Iraqi schools, homes, businesses, bridges, roads and hospitals pulverized by the war, and new security walls and barriers will require millions of tons of cement, one of the largest industrial sources of greenhouse gas emissions.
- In 2006, the US spent more on the war in Iraq than the entire world spent on renewable energy investment.
- By 2008, the Bush administration had spent 97 times more on military than on climate change. As a presidential candidate, President Obama pledged to spend \$150 billion over ten years on green energy technology and infrastructure — less than the United States was spending in one year of the Iraq war.
